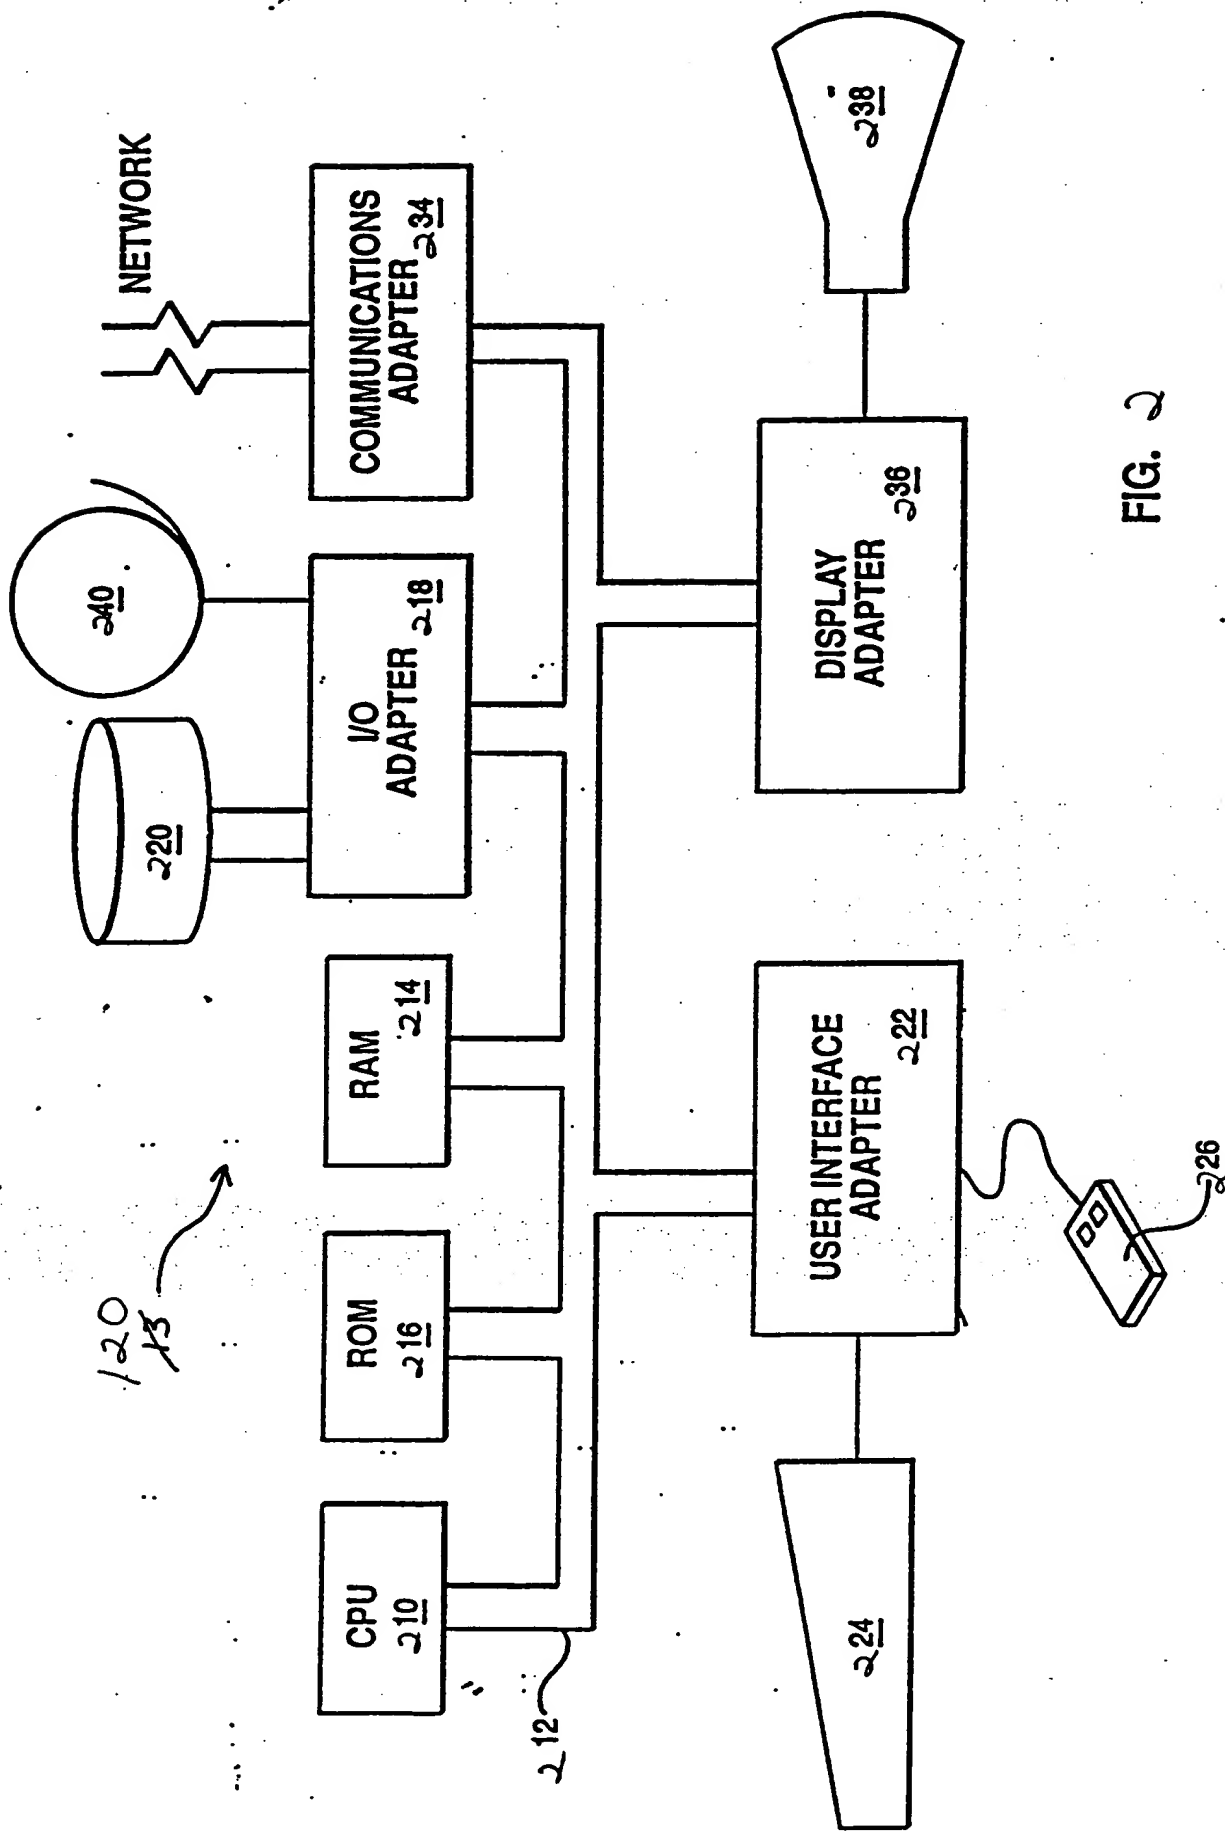

FIG. 2

Figure 3

300

310

Configuring a group database in a server node, where the group database comprises a group name and a list of members associated with the group name

320

Configuring a rules database in the server node, where the rules database associates the group name with a particular security policy, where the server node has the same security policy for each of the plurality of tunnels associated with the group name

330

Configuring a tunnel definition database in the server node, where a remote ID in the tunnel definition is defined as the group name, where the server node has the same tunnel definition for each of the plurality of tunnels associated with the group name

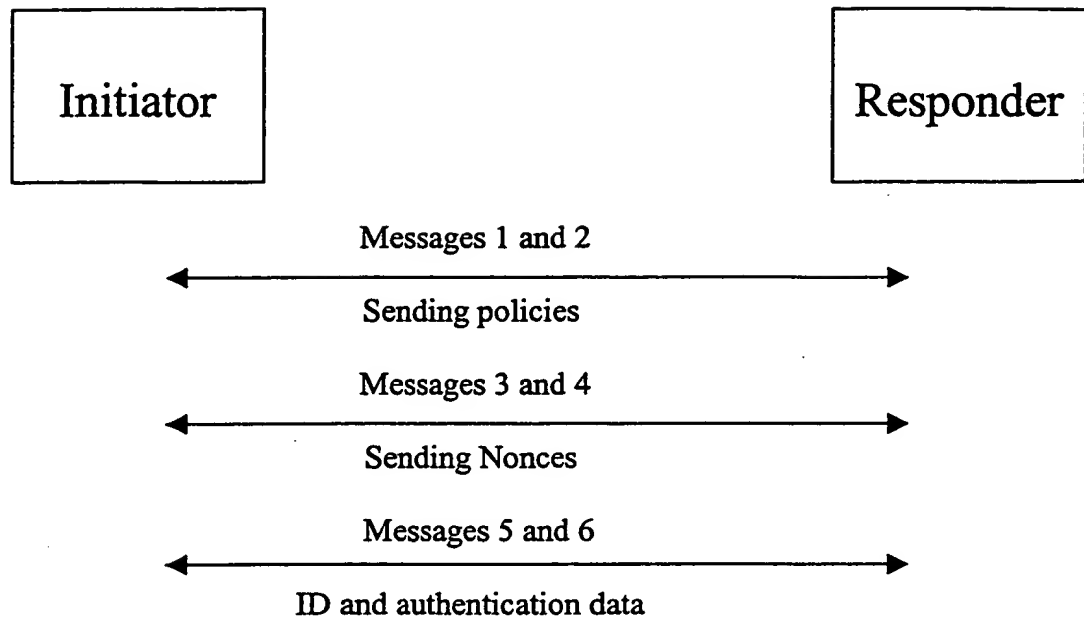

340

Activating a particular tunnel of the plurality of tunnels associated with the group name, where the particular tunnel is associated with a particular member of the group name

350

Transferring data across the particular tunnel
